## Overview

---

Now you have an idea of how much power your solar panels can produce so now you'll need a battery bank or portable solar power station so you can store that power for later use Use this formula to calculate the battery capacity f.

Battery C-rating is the measurement of the current in which a battery is charged and discharged. Every battery type has a different discharge rate Lead-acid, AGM, & GEL batteries usually have C-ratings of 0.2C, But lithium.

The job of a charge controller is to adjust the voltage output from the solar panels according to the battery voltage. Depending on the sunlight intensity the voltage of your solar panel's output will change accordingly. e.g.

Your output load & battery C-ratings will play a major role in selecting the right size inverter. Output load will be the total AC load that you desire to run with your solar panels. For example TV (50W), laptop (100W), & LED b.

On average you can expect 1600-2600 Wh or 260-320 watts out per hour from your 400W solar panel. The difference will depend on the weather conditions & solar panel tilt angle. Under ideal conditions, you can expect 400 watts of power per hour from your solar panel but it will rarely happen These numbers are the.
