

# A hotel energy storage system caught fire

## Overview

---

What happened at an Arizona energy storage facility?

In April 2019, an unexpected explosion of batteries on fire in an Arizona energy storage facility injured eight firefighters.

What happens if the energy storage system fails?

The energy storage system lacks effective protective measures, it may cause the expansion of battery accidents. If the energy storage device is arranged indoors, when the flammable gas reaches a certain concentration, it will explode in case of a naked fire, and more serious situation is the chain explosion accident.

What causes a fire accident in energy storage system?

According to the investigation report, it is determined that the cause of the fire accident of the energy storage system is the excessive voltage and current caused by the surge effect during the system recovery and startup process, and it is not effectively protected by the BMS system.

What are some safety accidents of energy storage stations?

Some safety accidents of energy storage stations in recent years . A fire broke out during the construction and commissioning of the energy storage power station of Beijing Guoxuan FWT, resulting in the sacrifice of two firefighters, the injury of one firefighter (stable condition) and the loss of one employee in the power station.

Are battery storage fires igniting?

The number of installations is on the rise, but a persistent problem keeps coming up — fires igniting at battery storage facilities. Most recently, a fire broke out at the Valley Center Energy Storage Facility in San Diego County on Sept. 18.

What happened to SDG&E energy storage facility?

Located on seven acres in a commercial-industrial zone, the facility opened in February 2022 and delivers energy to a nearby SDG&E substation. The Sept. 18 fire is under investigation, with fire officials saying they expect a final determination coming in about two months. The storage facility resumed operations the following day.
