Overview

What is a linear load flow for three-phase power distribution systems?

This letter proposes a linear load flow for three-phase power distribution systems. Balanced and unbalanced operation are considered as well as the ZIP models of the loads. The methodology does not require any assumption related to the ratio. Despite its simplicity, it is very accurate compared to the conventional back-forward sweep algorithm.

Is there a linear three-phase distribution power flow model for DPS?

Hence, despite abundant papers on linear single-phase power flow models, it is still necessary to study linear three-phase distribution power flow models. To this end, this paper proposes a physics-based and data-driven linear three-phase power flow model for DPSs.

How accurate is a three-phase power flow model?

Case studies have demonstrated that ours is more accurate than other linear three-phase power flow models, with the average errors reduced by 2- to over 10-fold for different test systems. Furthermore, this paper sheds light on several relevant issues.

Is DCPF a linear power flow model?

A classical and widely-used linear power flow model is direct current power flow (DCPF). However, it is well known that the precondition for DCPF's accuracy mainly holds for transmission power systems (TPSs) and will be invalid for distribution power systems (DPSs).

What is power flow analysis?

Index Terms—Data-driven, distribution power systems, linear power flow model, three-phase unbalancing, ZIP loads. I. INTRODUCTION POWER flow analysis is fundamental to power system planning and operation, underlying contingency analysis, optimal dispatch and control, etc.

Can a linear load flow method be used for distributed generators?

The distributed generators (DGs) with unity or fixed power factors can be easily included. But the power and voltage nodes cannot be dealt with directly and need to be further studied. By combining the current linear approximation with the loop theory-based method, a new linear load flow method for DPS has been proposed.
