

# A review on solar energy use in industries

## Overview

---

WHO [World health organization] PTC [Parabolic trough collector] SWH [Solar Water Heating].

Energy use has become a crucial concern in the last decades because of rapid increase in energy demand. Moreover, environmental issues of conventional energy resource.

A typical industrial energy system is composed of 4 main parts; power supply, production plant, energy recovery and cooling systems. Fig. 2 shows a block diagram of a typical industrial energy system.

It can be stated that solar thermal is the conversion of solar irradiation into heat. Among renewable energy systems, solar thermal is considered as the most economical alternative.

Nearly all the industrial energy networks and systems are partially or fully dependent on burning fossil fuels to generate essential thermal energy. Distribution of energy consumption in industrial facilities.

Can solar energy be used in industrial facilities?

In the literatures there is no comprehensive review on the applications of solar energy in industrial facilities. It is expected that this review will be very useful for industrial energy users, policy makers, research and development organizations, and environmental organizations. 2. Integration of solar energy into industrial systems.

Are solar energy systems suitable for industrial process applications?

It has been found that both solar thermal and PV systems are suitable for various industrial process applications. However, the overall efficiency of the system depends on appropriate integration of systems and proper design of the solar collectors. Solar energy systems can be considered either as the power supply or applied directly to a process.

Are solar powered systems reliable and cost-effective?

It may be reported that the solar powered systems are reliable and cost-effective.

effective. They are largely applied in industrial processes in line with energy sustainability issues. Primary energy consumption released by Shell shows remarkable growth in PV solar electricity by 2030.

Do building industries use solar energy?

Building industries use solar energy not only for heating and cooling purposes in ventilation and air conditioning systems but also to generate electricity by photovoltaic cells. PV solar industries definitely can contribute to the world electricity demand.

Is solar thermal a good choice for industrial applications?

It was found that solar thermal is getting remarkable popularity in industrial applications. Solar thermal is an alternative to generate electricity, process chemicals or even space heating. It can be used in food, non-metallic, textile, building, chemical or even business related industries.

How much energy will solar thermal supply in 2050?

A comparative study on the world energy consumption released by International Energy Agency (IEA) shows that in 2050, solar array installations will supply around 45% of energy demand in the world. It was found that solar thermal is getting remarkable popularity in industrial applications.
