Overview

How is AC power system modeled?

The AC power system is modeled using a generalized transformation from three-phase variables in the ABC frame to a single $d q$ -frame, enabling the representation of cables, overhead lines etc. while preserving inherent model complexities.

What is an example of a hybrid AC/DC power system?

Example of a hybrid AC/DC power system — point-to-point HVDC link with adjacent AC systems. The generators are denoted as 'gen', overhead lines with 'OHL', Y_{MMC} is the admittance of the MMC, and Z_{eq} is the equivalent impedance of the rest of the power system.

How does a DC system work?

The DC system employs a monopolar representation, or the bipolar representation with the bipolar to monopolar transformation applied. In addition, overhead line and cable models that are applicable for wide-bandwidth analysis are included in the model.

Should a stability analysis include both AC and DC sides?

It has been shown in [1], that both the AC and DC sides have similar properties when high-frequency interactions are concerned, and as such, it becomes ever more clear that a thorough stability analysis should ideally account for both sides at the same time.

Does DC-voltage-controller-related instability affect the stability of AC side waveforms?

The influence of the DC side on the stability on the AC side is demonstrated by carrying out a case study where a DC-voltage-controller-related instability affects the AC side waveforms. How to represent a bipolar DC component using ABCD parameters?

A bipolar DC component is represented using ABCD parameters as: (20) v_{p1}
 v_{p2} i_{p1} $i_{p2} = \begin{bmatrix} a_{11} & a_{12} & b_{11} & b_{12} \\ a_{21} & a_{22} & b_{21} & b_{22} \end{bmatrix} \begin{bmatrix} c_{11} & c_{12} \\ d_{11} & d_{12} \end{bmatrix} \begin{bmatrix} v_{s1} \\ v_{s2} \\ i_{s1} \\ i_{s2} \end{bmatrix}$, where a_{xy} , b_{xy} , c_{xy} and d_{xy} ,
for $x, y \in \{1, 2\}$, represent the entries of the matrices A, B, C and D.

With the improvement of people's living standards, the problem of voltage qualification rate in remote rural areas has become increasingly prominent. Under heavy load, the line voltage drop is relatively large, which is likely to cause the user voltage at the end of the line to be low.
