

Air-cooled generator wind temperature difference exceeds

Overview

Does ambient temperature affect the cooling of a generator?

It is revealed that the ambient temperature has a great influence on the cooling of the generator. It is verified that the cooling system has a good effect on the cooling of the generator. Ningqiang Shi: We have discussed and written in depth the content and structure of the manuscript.

Does ambient temperature affect the cooling of a permanent magnet wind turbine?

Taking a 2.5 MW PMSG permanent magnet wind turbine as an example, four kinds of ambient temperature were selected to be tested when the generator was full of power. It is revealed that the ambient temperature has a great influence on the cooling of the generator.

What is the wind speed of air cooled heat exchanger?

It is basically assumed that the wind speed of the external environment is 12.61 m/s, the air density is 1.127 kg/m³, the ambient temperature is 29.5 °C, the temperature of the engine room is 36 °C. Table 2 shows the pipeline arrangement scheme and the inlet and outlet temperature of the five air-cooled heat exchanger.

What are the requirements for generator cooling?

The requirements for generator cooling are: the cooling effect should reach the normal operating temperature range of the generator. The cooling of each part should be uniform, and local overheating should not occur. The structure of the cooling system should be as simple as possible and consume less power.

What are the advantages of air cooling system in large-scale turbine generators?

Comparing with the hydrogen and water cooling system, the air cooling

system has of the advantages of low-maintenance, easy-operation and simple cooling structures, which is considered for use in large-scale turbine generators. Thus, more and more air cooling system is adopted in large-scale turbine generators.

What is the average temperature rise of a stator winding?

The average temperature rise of the stator winding drops from 88.4 K without the air deflector to 82.5 K with the ring-type and 84.3 K with the half ring-type, down 5.9 K and 4.1 K, respectively. The drops are 6.7% and 4.6%, more significant than the decrease in hotspot temperature rise.
