

# Algae control under photovoltaic panels

## Overview

---

From a 'pond to wheel' point of view, the scope of the system encompasses the production of biomass, process conversion and its combustion in a middle-sized car. The construction, dismantling and final disposal of the infrastructure and machinery were also included, as well as the production of chemicals and their.

If more than one product is delivered from the system processes, all system flows must be divided proportionally to the energy content of the products, to the mass or to the market value. This division is called allocation.

The analysis considers *Chlorococccum* sp. and *Desmodesmus* sp, since both species can achieve efficient trade-off between growth rate, lipid accumulation and ease of cultivation [23, 24]. Data.

The volatile compounds emitted by raceways and inoculum ponds are CO<sub>2</sub>, N<sub>2</sub>O and NH<sub>3</sub>. These emissions highly depend on operating conditions, such as dissolved oxygen.

Microalgae cultivation in a module consists of 5 raceways of 8348 m<sup>2</sup> (2504.5 m<sup>3</sup> total volume) mixed with a paddlewheel (more information in Additional file 1: File S1, Sections 1.2 and 1.3). The.
