

# Analysis of the causes of fluctuations in wind power generation

**easy to install and use**

**World wide Products**

**faster charging and discharging**

**Multiple protection with alarm systems**

**Can save energy**

*the battery capacity can be increased freely and flexibly according to the situation of home use.*

*Rechargeable lithium batteries use safe LiFePO4*

## Overview

What causes the power fluctuation of wind turbines?

The random fluctuation of wind is the basic factor causing the power fluctuation of wind turbines.

How is power fluctuation corresponding to wind speed fluctuation expressed?

Power fluctuation corresponding to wind speed fluctuation is expressed by . The standard deviation form is used to reflect the absolute power fluctuation, as shown in ( 10 ) Power standard deviation indicates the absolute value of power fluctuation.

How can wind direction fluctuation be quantified?

A set of indicators are extracted to quantify the wind direction fluctuations. Fluctuations are a key characteristic of the wind resource. It is important to quantitatively analyze wind direction fluctuation due to its influence on the optimization of wind turbine yaw control.

How a T & p stable reflects wind direction fluctuation?

In summary, the indicators of  $\alpha A$ ,  $\alpha T$  and P stable calculated from the wind turbine SCADA wind resource data can reflect the wind direction fluctuation characteristics of the wind turbine accurately and directly. With larger values of  $\alpha A$ ,  $\alpha T$  and P stable, the local wind direction at the wind turbine will be more stable. 6.

How does wind speed affect power fluctuation?

To describe the influence of wind speed change on power fluctuation, the fluctuation coefficient of wind speed is defined as follows. The typical characteristic of wind is the randomness, that is, the change of wind speed with time and space is random.

What is the fluctuation coefficient of wind direction?

Test sample data mainly concentrates below rated wind speed. The fluctuation coefficient of wind direction is large in the constant region, and in the range of 0.05–1; in the transition region, its change range is small, between 0.03 and 0.18; and in the constant power region, its change range is between 0.03 and 0.15.
