

Bleeding power steering systems

Overview

Locate the power steering reservoir and twist the cap off. Read your vehicle's.

Bleed the system using a vacuum pump kit if your car has a bleed valve. Read your vehicle's manual to see if your power steering has a bleed valve. If it does, purchase a vacu.

You may end up with air in your power steering lines if you were working on your vehicle, replacing a part, or you have a minor leak in the power steering lines. If air does find its way inside of the power steering assembly, you may hear a growling noise when you drive and the steering wheel may be slightly harder to.

To bleed a power steering system, you need to find and loosen the bleeder screw located on the power steering pump, then start up the engine and turn the steering wheel left and right until no more air comes out of the loosened bleeder screw. After the air is released, tighten the bleeder screw and top off the power steering fluid. How to bleed power steering?

A bleed hose and catch container are also necessary to catch the old fluid as it's sucked out of the system. Lastly, it's a good idea to have some rags or paper towels on hand to wipe up any spills or drips. Once you have everything you need, you'll be ready to start the power steering bleeding process using your vacuum pump.

Should I Bleed my power steering pump?

If you have replaced the power steering pump or a high pressure powersteering hose than you WILL HAVE TO bleed it or you are risking to damage your power steering pump.

What happens if a power steering system is bled?

It's an important process to understand though: an improperly bled power steering system can result in poor steering, a noisy pump, and worse yet—total pump failure. To compound the issue, despite both systems relying on hydraulics, the bleeding process for power steering is significantly different than that of a brake system.

Do you need a bleed valve for power steering?

Most vehicles don't come with one because it's fairly easy to bleed the power steering without a vacuum kit. You can buy a reservoir cap with a bleed valve adaptor on the lid if you want to use a vacuum kit to pump your power steering lines but you don't have a built-in bleed valve.

Can You Bleed power steering with a cap on?

By doing this, air will be forced into the steering fluid reservoir and out of the system. Some people ask whether it is okay to bleed power steering with a cap on or off. It is important to note that you must keep the reservoir cap on to avoid bubbling fluid pouring out while bleeding the power steering.

How do you check a power steering bleed valve?

Read your vehicle's manual to see if your power steering has a bleed valve. If it does, purchase a vacuum pump kit for a power steering system and slide the end of the vacuum pump's hose over the bleed valve. Then, pull the trigger on the vacuum until the gauge on the pump reads 20 Hg (inches of mercury).
