

Calculate power generation from wind power curve

Overview

How do you find the power curve of a wind turbine?

Power Curve (P m vs. Ω) This curve is obtained by projecting on the mechanical power and speed axes of the wind turbine (P- Ω curve). Figure 3 shows the P- Ω curve of a 2 MW wind turbine. Ω_{min} : Minimum wind turbine speed. Ω_0 : Initial speed of the wind turbine where it starts to produce optimal electrical energy.

What is wind turbine power curve?

The wind turbine power curve shows the relationship between the wind turbine power and hub height wind speed. It essentially captures the wind turbine performance. Hence it plays an important role in condition monitoring and control of wind turbines.

How do you calculate the power of a wind turbine?

The power in the wind is given by the following equation: $Power (W) = 1/2 \times \rho \times A \times v^3$ Thus, the power available to a wind turbine is based on the density of the air (usually about 1.2 kg/m^3), the swept area of the turbine blades (picture a big circle being made by the spinning blades), and the velocity of the wind.

How can power curves be used to monitor wind turbine performance?

Power curves can be used for monitoring the performance of turbines. For this, a benchmark curve which represents the performance of a normally operating turbine is required. This reference curve can be extracted from measured power output and wind speed data of wind turbines.

How to calculate the output power of a wind turbine?

Multiplying these two values produces an estimate of the output power of the wind turbine. Below you can find the whole procedure: 1. Sweep area of the turbine. Before finding the wind power, you need to determine the swept area

of the turbine according to the following equations: For HAWT: $A = \pi \times L^2$ For VAWT: $A = \pi \times L^2$

What is the power curve of a pitch regulated wind turbine?

Typical power curve of a pitch regulated wind turbine. The power curve of a WT indicates its performance. Accurate models of power curves are important tools for forecasting of power and online monitoring of the turbines. A number of methods have been proposed in various works to model the wind turbine power curve.
