

# **Calculation method of ampere-hour of lithium battery**

## Overview

---

To calculate a battery's amp hours, divide its watt hours by its voltage.

Formula: battery amp hours = battery watt hours ÷ battery voltage

Abbreviated: Ah = Wh ÷ V

How do you calculate SOC in a lithium battery?

The SOC calculation using the ampere-hour integration method is given by Eq. (12):

$$SOC_t = SOC_{t-1} + \int_{t-1}^t \frac{I}{Q} dt$$

Therefore, the complex discharge process of lithium primary batteries can be divided into multiple constant current discharge stages. For each stage, the SOC is calculated using the ampere-hour integration method.

How to estimate a lithium primary battery SoC?

In summary, depending on the application scenario of the lithium primary battery, the stress accumulation method or the EIS graphical method can be used to estimate the SOC with high accuracy. In addition, this paper develops a "lithium primary battery SOC estimation app" to facilitate further research.

How accurate is state of charge estimation using ampere-hour integration method?

The accuracy of state of charge (SOC) estimation using the ampere-hour integration method is relatively high during single discharge scenarios or multiple charge cycles of batteries. For lithium primary batteries, which undergo only a single battery cycle, the SOC estimation using the ampere-hour integration method is theoretically accurate.

How to verify lithium primary battery SoC estimation based on stress accumulation method?

Verification 7.1. Verification of lithium primary battery SOC estimation based on the stress accumulation method

Dynamic discharge tests were conducted with three current levels, four current levels, and five current levels. The time, current, and voltage data were collected during these dynamic discharge tests.

How do you estimate a battery's SoC?

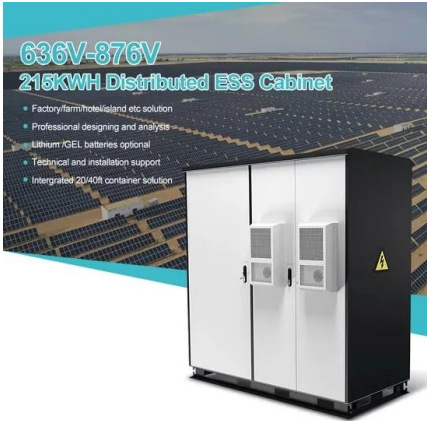

The proposed approaches are the Ampere-Hour integral method, which exploits the fundamental relationship between a battery's current and charge to continually estimate the SOC. The basic and advanced versions are described, followed by the EKF, which is a feedback-controlled prediction-correction estimator.

Can battery capacity prediction be used for SOC estimation?

Then, the actual battery capacity prediction value was used to replace the battery rated capacity in the traditional ampere-hour integral method, and the value was brought into the improved ampere-hour integral method for SOC estimation.
