

Calculation of active power deficit in microgrid

Overview

Can a microgrid buy power?

Data sets of PV, wind, and load are obtained with their associated probabilities for each of the ten scenarios. The grid can be considered the virtual generator. A microgrid can buy power when there is a deficit and supply power when it has excess renewable generation.

How to solve economic load dispatch problem in a microgrid?

The main aim is to minimise the overall cost of the microgrid, and a scenario-based method is modelled for the uncertain nature of RESs (PV and wind) and load. The economic load dispatch problem has been solved using two popular metaheuristic algorithms, the Grey-Wolf algorithm and Jaya. Jaya and PSO performed equally well compared to GWO.

What makes Islanded microgrids feasible?

The core element to make islanded microgrids feasible is a distributed generation (DG) . Among the various type of DGs, the portion of renewable generation such as wind power and photovoltaic is increasing gradually with awareness of environmental issues [3, 4].

What is a microgrid & how does it work?

Microgrid (MG) is a scaled-down version of the conventional grid. It is self-sufficient and can supply the local demands of a particular geographic area. The active components of the MG are renewable energy sources like wind turbines (WT), photovoltaic (PV), micro-hydro generators, biomasses, fuel cells, etc.

Which droop scheme is used in An islanded microgrid?

In the previous study, P-Q droop scheme of a renewable generator was introduced, and the coefficient of the P-Q droop was calculated. However, P-f and Q-V droop scheme representing power sharing was not considered.

Hence, considering the droop scheme commonly used in an islanded microgrid should be necessary.

Can LV microgrid CIGRE test system reduce solar output for 24 hours?

Reduced scenarios of solar output for 24 hours. To validate the proposed methodology, a standard LV Microgrid CIGRE test network is considered. The various data of LV MG CIGRE test system for wind turbine, photovoltaic, battery energy storage system, controllable load etc. are collected from 43.
