

# **Can switches and sockets be equipped with photovoltaic panels**

## Overview

---

Can a photovoltaic system be connected to a building electrical installation?

Indeed, a photovoltaic system can be connected to the building electrical installation at different places: to the main low-voltage (LV) switchboard, to a secondary LV switchboard, or upstream from the main LV switchboard. These options, their advantages and drawbacks are discussed in this blog post. [1](#).

Should I connect solar panels to my house wiring in the UK?

Regular maintenance and monitoring of your solar panel system will help ensure its optimal performance and longevity. Connecting solar panels to your house wiring in the UK allows you to harness renewable energy and reduce your reliance on the grid. This step-by-step guide will walk you through the process, ensuring a safe and efficient connection.

Can a photovoltaic inverter convert a solar panel?

If the conversion of the power produced by the solar panels is done by more than one photovoltaic inverter, it is recommended that the output of those inverters be grouped by connecting them to a secondary LV switchboard, which is then connected to the main LV switchboard at a single point.

Can a PV system be connected to a secondary switchboard?

In this case, connecting the PV system to a secondary or main switchboard would overload the existing electrical infrastructure and would require its modification, such as replacement of cables, switchboards, and protection equipment.

What are the different types of solar panel wiring?

Learning the basics of solar panel wiring is one of the most important tools in your repertoire of skills for safety and practical reasons, after all, residential PV installations feature voltages of up to 600V. There are three wiring types for PV modules: series, parallel, and series-parallel.

Can solar panels be wired in parallel?

You should know that there are limitations for series solar panel wiring. In the U.S., solar strings are required to feature a maximum voltage of 600V, so solar arrays comply with article 690 section 7 of the National Electrical Code (NEC 690.7). Wiring solar panels in parallel increases the output current, while keeping the voltage constant.
