

Can you still generate wind power with a force 12 wind

Overview

How do you get power from wind energy?

There are several ways to get power from wind energy. Wind turbines can be built on land, on lakes or in the ocean, in remote wilderness far from the power grid, within cities, or across vast plains. One wind turbine can power an individual home or farm, but several built close together form a wind energy plant, or wind farm.

Can a wind turbine power a home?

One wind turbine can power an individual home or farm, but several built close together form a wind energy plant, or wind farm. Wind plants can be land-based or offshore, and they can be hybrid plants (meaning, they include other sources of energy, such as solar energy).

How do scientists use wind energy to generate electricity?

Scientists and engineers are using energy from the wind to generate electricity. Wind energy, or wind power, is created using a wind turbine. As renewable energy technology continues to advance and grow in popularity, wind farms like this one have become an increasingly common sight along hills, fields, or even offshore in the ocean.

How much power does a wind turbine produce?

Most large turbines produce their maximum power at wind speeds around 15 meters per second (33 mph). Considering steady wind speeds, it's the diameter of the rotor that determines how much energy a turbine can generate.

Should I buy wind energy if I live near a wind farm?

If you choose to purchase wind energy and you live in the general vicinity of a wind farm, the electricity you use in your home might actually be wind-generated; more often, the higher price you pay goes to support the cost of

wind energy, but the electricity you use in your home still comes from system power.

How much energy does wind power supply?

The Battelle Pacific Northwest Laboratory, a U.S. Department of Energy science and technology lab, estimates that wind power is capable of supplying 20 percent of the United States' electricity based on wind resources alone. The American Wind Energy Association puts that number at a theoretical 100 percent.
