

Carbon-cement supercapacitors as a scalable bulk energy storage solution

Overview

Carbon-cement supercapacitors are a scalable bulk energy storage solution^{1,2,3}. Researchers at the Massachusetts Institute of Technology (MIT) have discovered that cement and water, combined with a small amount of carbon black, create a powerful, low-cost supercapacitor that could provide a scalable, bulk energy storage solution suitable for a variety of applications². The availability, versatility, and scalability of these carbon-cement supercapacitors opens a horizon for the design of multifunctional structures that leverage high energy storage capacity, high-rate charge/discharge capabilities, and structural strength for sustainable residential and industrial applications¹. Can material precursors be used for energy storage in supercapacitors?

Herein, we investigate such a scalable material solution for energy storage in supercapacitors constructed from readily available material precursors that can be locally sourced from virtually anywhere on the planet, namely cement, water, and carbon black.

Can concrete-like supercapacitors be used for bulk energy storage?

These properties point to the opportunity for employing these structural concrete-like supercapacitors for bulk energy storage in both residential and industrial applications ranging from energy autarkic shelters and self-charging roads for electric vehicles, to intermittent energy storage for wind turbines.

Can a carbon-cement supercapacitor store energy?

MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy. Made of just cement, water, and carbon black, the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar or wind energy.

Could a supercapacitor provide cheap and scalable energy storage?

Made of cement, carbon black, and water, the device could provide cheap and scalable energy storage for renewable energy sources. MIT engineers have

created a “supercapacitor” made of ancient, abundant materials, that can store large amounts of energy.

What can carbon-cement supercapacitors do?

Another potential application for carbon-cement supercapacitors is for building concrete roadways that could store energy produced by solar panels alongside the road and then deliver that energy to electric vehicles traveling along the road using the same kind of technology used for wirelessly rechargeable phones.

Are carbon black supercapacitors a good choice for bulk energy storage?

More specifically, high-rate capability supercapacitors rely on through a saturating electrolyte to or away from the surface layer. Herein, we argue that carbon black. This synergy makes our materials good candidates for bulk energy storage for residential and industrial applications.

Carbon-cement supercapacitors as a scalable bulk energy storage solution

Carbon-cement supercapacitors as a scalable bulk energy storage solution

Fig. 2. Capacitance measurements and analysis: (A) (1) An electric double layer capacitor (EDLC) composed of (2) two polished, electrolyte saturated carbon-cement electrodes (thickness d) separated by (3) a glassy fiber membrane soaked in the same electrolyte (1M KCl), and covered by (4) conductive graphite paper. The electrodes are (5) prestressed in (6) a closed cell to ...

Carbon-cement supercapacitors as a scalable bulk energy storage solution

Fig. 3. Experimentally derived scaling relations: (A) Rate-independent capacitance of eight different carbon-cement electrode materials showing the intensive nature of the energy storage capacity of our electrode systems. (B) Rate-dependent capacitance scaled along the horizontal axis by means of the classical dimensionless diffusion variable $= d^2/(D t_0)$. All measured ...
