

Common sources of harmonics in power systems

Overview

In an AC system, a harmonic is a voltage or current waveform whose frequency is an integer multiple of the fundamental frequency. Harmonic frequencies are produced by the action of non-linear loads such as diodes, thyristors, or saturated transformers. They are a frequent cause of problems and can result in increased equipment and conductor heating, misfiring in inverters, and torque pulsations in motors.

Common sources of harmonics in power systems

Harmonics in Power System , Electrical India Magazine

Power system harmonics is an area that is receiving a great deal of attention recently. The increase in proportion of non-linear load has prompted more stringent recommendations (IEEE Std. 519 & IEC61000-4-7) and stricter limits imposed by utilities.

Harmonics in Power System

The actual power system, however, contains voltage or current components, called harmonics, whose frequencies are integral multiples of the power system frequency. The second harmonic for a 60 Hz system is 120 Hz, the third harmonic is 180 Hz, etc. Typically, only odd harmonics are present in the power system.

Causes and Effects of Harmonics in Electrical Power Systems

Power quality is an estimate of how stable the electrical system is, often this is described as "power quality health." This is measured on three-phase electrical systems using instrumentation that considers several variables. Troubleshooting power quality issues will help your facility save money by optimizing energy use and protect equipment from future damage. The first step to

3 Causes of Harmonics on your power system

Harmonics are caused by non-linear loads on a power system. Typically, electric current is produced as a sine wave: these loads draw power that is not a sine wave, and as a result, produce harmonics. ,image1,IEEE Std 141-1993 (page 446-447) gives an excellent list of devices that might cause harmonics on your system:
