Balanced Three-phase Power Analysis

The constant nature of the instantaneous power is one advantage found in using three-phase systems to generate and distribute power. Real/Average Power per phase Since the instantaneous power is constant over time, we can define the Average (or Real) power per phase as the following:  $P_{\text{phase}} = \frac{P}{3} = \frac{3V_{\text{pl}} \text{pcos}(\theta)}{3}$   $P_{\text{phase}} = \dots$
