Overview

The transmission substation carries the overhead lines which transfer the generated e.

The portion of the transmission system that connects the high voltage substations through the step-down transformer to the distribution substations is called the sub-transmission syst.

The component of an electrical power system connecting all the consumers in an area to the bulk power sources is called a distribution system. The bulk power stations are connected to.

In generating station the fuel (coal, water, nuclear energy, etc.) is converted into electrical energy. The electrical power is generated in the range of 11kV to 25kV, which is step-up for long distance transmission. The power plant of the generating substation is mainly classified into three types, i.e., thermal power.

The transmission substation carries the overhead lines which transfer the generated electrical energy from generation to the distribution substations. It only supplies the large bulk of power to bulk power substations or very big consumers. The.

The component of an electrical power system connecting all the consumers in an area to the bulk power sources is called a distribution system. The bulk power stations are connected to the generating substations by transmission lines. They feed some substations.

The portion of the transmission system that connects the high voltage substations through the step-down transformer to the distribution substations is.
