

# Compressor power system

**12.8V 100Ah**

## Overview

---

How much power does a compressor use?

Compressors are rated for 400 scfm at site conditions, consuming 100 hp at 115 psig and 70 hp at 50 percent load. Each compressor has a 20-second start-permissive (off to full-load). Total system storage is 660 U.S. gallons.

What is a compressor control?

Compressor controls build upon this minimum requirement, forcing the system to operate at a higher pressure with the amount and variability dependent upon components, configuration and system characteristics.

How many gallons does a compressor hold?

Each compressor has a 20-second start-permissive (off to full-load). Total system storage is 660 U.S. gallons. For simplicity, the system has no filters or dryers and total  $\Delta P$  from compressor package discharge to furthest point in the network is  $<0.4$  psi.

Does pressure affect compressor power?

These corrective actions can be costly and intrusive, so accuracy of current and proposed state is essential to ensure corrective actions will deliver defined returns. Reducing system pressure can potentially lower compressed air consumption and compressor power. The balance of this article reviews the influence of pressure on compressor power.

What is a positive displacement compressor?

For a positive displacement compressor, like a rotary screw compressor or a reciprocating (piston) compressor, this change in pressure is generally assumed within the industry to represent approximately 0.5 percent drop in power for every 1 psi reduction at the discharge.

What is a Pascal rotary screw air compressor?

The PASCAL Series comprises a comprehensive range of premium quality rotary screw air compressors from 2.2 kW to 15 kW. Each model is constructed to the highest standard using the best quality components in order to ensure a long life and total reliability.
