

Continuous short circuit of photovoltaic panels affects the inverter

Overview

What is a short-circuit analysis of grid-connected photovoltaic power plants?

This paper presents a short-circuit analysis of grid-connected photovoltaic (PV) power plants, which contain several Voltage Source Converters (VSCs) that regulate and convert the power from DC to AC networks. A different methodology has been adopted in this paper for short-circuit calculation.

Can VSCs be used in short-circuit analysis of grid-connected photovoltaic power plants?

Abstract: This paper presents a different approach for shortcircuit analysis of grid-connected photovoltaic (PV) power plants, where several Voltage Source Converters (VSCs) are adopted to integrate PV modules into the grid. The VSC gridsupport control and various potential current-saturation states are considered in the short-circuit calculation.

What are the short-circuit transient characteristics of photovoltaic (PV)?

The short-circuit transient characteristics of photovoltaic (PV) are different from traditional power sources. When the grid voltage in the impedance, and as a disturbance term it generates a new 1. Introduction.

Why are PV inverters able to supply more short circuit current?

In principle the PV inverters are able to supply more short circuit current during fault scenarios than only 1 p.u. reactive current due to current reserve margin of the inverter system. The control is able to limit the current injection during faults to the nominal but also to an overload current limitation of the generation system.

Why are PV inverters required during a short-circuit fault?

During the short-circuit fault, the PV inverters are required to provide the grid-voltage support required by the grid codes , . It is assumed that the fault can be detected instantaneously and a fault signal is generated.

Why do PV inverters have reactive power control?

All inverters were operating with nominal active power and a power factor of 1 at the medium voltage level prior to fault. So the inductive reactive powers of the three transformers are compensated by the reactive power control of PV inverters.
