

# Control of large power systems

## Overview

---

What types of power systems are used in large-scale complex power systems?

In large-scale complex power systems, renewable power generators, flexible power electronics converters, and distributed controllers are widely employed.

Can a nonlinear decentralized control scheme be applied to large-scale power systems?

In this paper we apply the recently developed nonlinear decentralized control scheme ( Guo et al., 1998) to large-scale power systems. Nonlinear decentralized robust controllers are designed explicitly for the excitation model and turbine-governor model, where the interconnections among generators are bounded by nonlinear functions.

Are synchronous generators a threat to large-scale power systems?

With conventional fossil-fueled synchronous generators in the transmission network being replaced by renewable energy generation which is highly distributed across the entire grid, new challenges are emerging to the control and stability of large-scale power systems.

What is power system stability analysis & control?

This book offers a systematic stochastic analysis of these nonlinear problems and provides comprehensive countermeasures to improve power system performance and control with large-scale, hybrid power systems. Power system stability analysis and control is by no means a new topic.

Do power systems need new analysis and control methods?

New analysis and control methods are needed for power systems to cope with the ongoing transformation. In the CSEE JPES forum, six leading experts were invited to deliver keynote speeches, and the participating researchers and professionals had extensive exchanges and discussions on the control and

stability of power systems.

What is a stable operation of power system?

Stable operation of power system requires matching between total generation with total load demand and with accompanying system losses. Due to rising and falling of load demand, the real and reactive power balance is disturbed, resulting deviation of system frequency and tie-line interchange power from their scheduled value.
