What is wind energy & how does it work?

Wind energy is a form of renewable energy, typically powered by the movement of wind across enormous fan-shaped structures called wind turbines. Once built, these turbines create no climate-warming greenhouse gas emissions, making this a “carbon-free” energy source that can provide electricity without making climate change worse.

What is distributed wind energy?

The term “distributed wind energy” (sometimes called “onsite wind energy”) refers to turbines installed locally to meet nearby energy needs. Distributed wind energy installations are typically used by a community, company, utility, or homeowner to power their specific needs.
