

Design of a resonant snubber inverter for photovoltaic inverter system

Overview

Can a solar-powered partial resonant inverter interface with an asymmetrical cascaded 9-level invert?

This paper presents a solar-powered Partial Resonant Inverter (PRI) interfaced with an asymmetrical cascaded nine-level inverter. The DC input of the proposed system is obtained using Solar Photovoltaic (SPV) panel. The input DC sources fed to the asymmetrical cascaded nine-level inverter are in the ratio of 1:3.

What is partial resonant inverter (PRI)?

The partial resonant inverter (PRI) associated with the solar PV panel converts the DC power available from the PV panel into AC power. In order to control the proposed system and to maintain the voltage levels at the desired ratio, a closed-loop control strategy is implemented with the help of SMC.

Do resonant inverter topologies use zero voltage switching (ZVS)?

Comparison with various resonant inverter topologies from literature. It is observed that most of the topologies use zero voltage switching (ZVS) and the switch count of various topologies have been reduced. Greater switch count leads to losses in the system thereby reducing the efficiency of the system.

How does a resonant AC inverter work?

From the resonant AC link, the power is transferred to two H bridges of the nine-level inverter through two diode bridge rectifiers. The single-phase AC load in the prototype is considered to be 60W and the solar PV panel is with a maximum rating of 125W.

Which resonant inverter uses 12 Bidirectional switches?

In [12] the authors introduced a resonant inverter that uses 12 bidirectional switches. The ac link inverter uses the pulse density modulation method (PDM) for switching the 12 bidirectional switches. An HFI based on the

buck-boost concept is implemented in [13]. It uses four unidirectional and six bidirectional switches.

What is the DC input of a solar photovoltaic (SPV) system?

The DC input of the proposed system is obtained using Solar Photovoltaic (SPV) panel. The input DC sources fed to the asymmetrical cascaded nine-level inverter are in the ratio of 1:3. The step modulated nine-level inverter works with a precalculated switching angle for a fixed modulation of 0.7.
