

# **Design of photovoltaic panel arrangement on roof**

## Overview

---

Ideally in the UK, solar panels should be installed on a south-facing roof. This orientation maximises the exposure to sunlight throughout the day, ensuring consistent energy generation. What makes a good roof for a solar PV system?

The pitch (slope) of the roof: Many industrial facilities have roofs that are relatively flat, with just enough slope to allow for water drainage. A flat roof is an ideal candidate for a ballasted (weighted) mounting system, whereby the solar PV system is simply affixed in place using concrete blocks.

How do you mount a solar PV system on a flat roof?

A flat roof is an ideal candidate for a ballasted (weighted) mounting system, whereby the solar PV system is simply affixed in place using concrete blocks. For roofs with greater pitch, the system will need to be held in place with mechanical anchors that attach to the structural system below.

Should a solar PV array be installed on a new flat roof?

Any solar designer or specifier should give the same focus to ensuring the rooftop array is installed with methods that have as little impact as possible on the building and its waterproofing and that the array works to its maximum potential for its entire lifespan. There are numerous reasons for including a solar PV array on a new flat roof.

What are the components of a photovoltaic system?

A photovoltaic system consists of various components that work together to convert sunlight into electricity. The main components of a PV system include: Solar panels: These are the primary component of a PV system and consist of numerous PV cells. Solar panels are responsible for capturing sunlight and converting it into electricity.

What is a roof mounted photovoltaic system guidance?

The guidance refers only to the mechanical installation of roof mounted

integrated and stand-off photovoltaic systems; it provides best practice guidance on installation requirements and does not constitute fixing instructions.

What are the characteristics of a solar roof?

There are several roof characteristics that effect how much your solar panels will produce. Here is the top six: Also known as azimuth, orientation is the direction your roof faces. For North American solar systems, the best roof design for solar panels is one with a large, unshaded south face (an azimuth of 180 degrees).
