What is a solar cell p-n junction diode?

A solar cell is basically a p-n junction diode. Solar cells are a form of photoelectric cell, defined as a device whose electrical characteristics – such as current, voltage, or resistance – vary when exposed to light. Individual solar cells can be combined to form modules commonly known as solar panels.

What is the equivalent circuit model for a solar cell?

One basic equivalent circuit model in common use is the single diode model, which is derived from physical principles (e.g., Gray, 2011) and represented by the following circuit for a single solar cell: The governing equation for this equivalent circuit is formulated using Kirchoff's current law for current  $I$ :

$$I = I_L - I_D - I_{sh}$$

How do I model a number of solar cells connected in series?

You can model any number of solar cells connected in series using a single Solar Cell block by setting the parameter Number of series-connected cells per string to a value larger than 1. Internally the block still simulates only the equations for a single solar cell, but scales up the output voltage according to the number of cells.

What does  $I_d$  represent in a single diode model?

Here,  $I_L$  represents the light-generated current in the cell,  $I_D$  represents the voltage-dependent current lost to recombination, and  $I_{sh}$  represents the current lost due to shunt resistances. In this single diode model,  $I_D$  is modeled using the Shockley equation for an ideal diode:.

How do you draw a solar cell circuit diagram?

Forward, reverse, and zero bias conditions are represented on the same curves. Draw I-V curves for the solar cell. With a dot, denote the “operating

point” for each bias condition. With arrows, denote the magnitude of the the saturation current ( $I_0$ ). Draw equivalent circuit diagrams for each bias condition. Draw the external bias ( $V_A$ ).

How does a solar cell differ from a junction diode?

A solar cell functions similarly to a junction diode, but its construction differs slightly from typical p-n junction diodes. A very thin layer of p-type semiconductor is grown on a relatively thicker n-type semiconductor. We then apply a few finer electrodes on the top of the p-type semiconductor layer.
