## Overview

---

Are dipolar glass polymers suitable for high-temperature capacitive energy storage?

However, the low permittivity and relatively low operating temperature of dielectric polymers limit the high-temperature capacitive energy storage applications. Fortunately, dipolar glass polymers are demonstrated as the preferred materials to achieve high dielectric constant, low dielectric loss and high energy density at elevated temperatures.

Can Dipole polarization improve discharged energy density?

Enhancing dipole polarization has been demonstrated as an effective approach to increase the dielectric constant of polymer dielectrics and thus to improve their discharged energy density for energy storage applications in electrical power and electronic systems.

What are dipolar-glass polymers?

Recently, to gain relatively high  $\epsilon_r$  and lower loss, an alternative dipolar-glass (DG) polymer approach has been proposed. DG polymers are synthesized with the weakly coupled dipolar groups incorporated into the main chains (main-chain DG polymers) or attached to the side chains of polymers (side-chain DG polymers).

How does storage energy density correlate with electric displacement?

The storage energy density ( $U_e$ ) of dielectric materials correlates with electric displacement ( $D$ ) and applied electric field  $E$  as  $U_e = \int_0^D E dD$ .

Can polymer dielectrics be used as energy storage media?

Polymer dielectrics are considered promising candidate as energy storage media in electrostatic capacitors, which play critical roles in power electrical systems involving elevated temperatures, such as hybrid electric vehicles, oil & gas exploration, aircraft, and geothermal facilities 1, 2, 3, 4, 5, 6.

Can dipolar glass polymers achieve high dielectric constant based on orientational polarization?

Fortunately, dipolar glass polymers are demonstrated as the preferred materials to achieve high dielectric constant, low dielectric loss and high energy density at elevated temperatures. In this review, we critically elaborate on the recent progress of dipolar glass polymers based on orientational polarization from molecular engineering.
