

# Disaster-proof microgrid

## Overview

---

What are future-proof and resilient urban microgrids?

To identify future-proof and resilient urban microgrids, we examine a wide range of potential threats. This encompasses natural disasters affecting physical infrastructure and microgrid failures, such as those induced by cyber attacks. We term this composition of potential future threats as our baseline scenarios.

Can microgrids enhance power system resilience?

Microgrids are emerging as an effective solution for enhancing power system resilience while providing opportunities to integrate distributed renewable energy generation efficiently into the utility grid during normal operations.

What is a microgrid?

The term “microgrid” refers to the concept of a small number of DERs connected to a single power subsystem. DERs include both renewable and /or conventional resources . The electric grid is no longer a one-way system from the 20th-century . A constellation of distributed energy technologies is paving the way for MGs , , .

Are microgrids more vulnerable to cascading power system blackouts?

Microgrids, as localized resilience solutions, are less vulnerable to cascading power system blackouts. The U.S. Department of Energy (DOE) defines a microgrid as 'a group of interconnected loads and distributed energy resources within clearly defined electrical boundaries that acts as a single controllable entity with respect to the grid.'

Are microgrids resilient during disruptive events?

Microgrids can be made more resilient during a disruptive event by considering a set of mitigation measures in the planning phase of their design. This increases microgrids' robustness or resistance and maintains supply. (In

the Original Operational Mode section of Fig. 8 ).

What is a microgrid resilience assessment?

A microgrid's resilience assessment begins with listing all relevant threats to a system, inclusive of severe weather events (i.e. thunderstorms), natural disasters (i.e. earthquakes), and human factors (i.e. terrorism). Threat likelihoods are parameterized as described above and assigned a level of importance.
