## Overview

---

Why do we need a smart grid and a microgrid?

The competitive landscape among energy providers and distributors has empowered consumers to not only save money on their energy bills but also incorporate sustainable energy sources into the grid. To efficiently manage electricity distribution, deregulated power systems must include a smart grid and microgrid (MG).

Are microgrids the future of power supply?

The development of microgrids (MGs) and smart grids, as creative alternatives to the traditional power grid structure, has prepared the way for the development of the future of power supply. RE is required because of its multiple benefits, including being an inexhaustible supply of free energy with no emissions.

What is Microgrid technology?

It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential. In this article, a literature review is made on microgrid technology.

Are microgrids a potential for a modernized electric infrastructure?

1. Introduction Electricity distribution networks globally are undergoing a transformation, driven by the emergence of new distributed energy resources (DERs), including microgrids (MGs). The MG is a promising potential for a modernized electric infrastructure , .

How MGs and smart grids can help a deregulated electricity system?

As a result, MGs and smart grids present distinct potential and problems in deregulated electricity systems characterized by competition and market dynamics. By incorporating RE and improving grid dependability, these

decentralized energy systems can help to create a more sustainable and resilient power grid.

Will grid-tied microgrid customers stay connected if the grid fails?

Although grid-tied microgrid customers will likely stay connected to the grid for the foreseeable future, only islanding in the case of utility grid failure, self-consumption of microgrid generated energy could erode the revenue base that has traditionally paid for utility infrastructure investments.
