

# **Diy home solar system with battery backup**

## Overview

---

We need a fuse between the solar panels and the charge controller. The size of the fuse will be indicated on the solar panel specifications. In this case, the maximum series fuse is 10.

Next, we will wire the solar panels to the existing system. As you can see on the schematic, the two solar panels are wired in series. That means that the negative of the first panel is conn.

The wires from the solar panels to the charge controllers will be longer than other wires in the system. That's why we need to do a voltage drop calculation. I have made a video about wh.

Now we need to select the charge controller. We have to calculate two things here. 1. The first is the current to the battery, 2. The second is the maximum input voltage of t.

The solar panels should charge the battery in one day. In most locations, the amount of sun hours per day is 3. Remember that our usable battery capacity was 600wh?

If we divide 600wh by 3 hours, we become 200 Watts. So we need 200 Watts worth of solar panels to recharge the battery in one day. To keep the.

We need a fuse between the solar panels and the charge controller. The size of the fuse will be indicated on the solar panel specifications. In this case, the maximum series fuse is 10Amps. We.

The wires from the solar panels to the charge controllers will be longer than other wires in the system. That's why we need to do a voltage drop calculation. I have made a video about why we must.

Now we need to select the charge controller. We have to calculate two things here. 1. The first is the current to the battery, 2. The second is the maximum input voltage of the charge.

Next, we will wire the solar panels to the existing system. As you can see on the schematic, the two solar panels are wired in series. That means that the negative of the first panel is connected to the positive of the second panel. If we do that, we will have one positive and one.
