

Do inverters belong to the photovoltaic sector

Overview

Inverters used in photovoltaic applications are historically divided into two main categories: 1. Standalone inverters 2. Grid-connected inverters
Standalone inverters are for the applications where the PV plant is not connected to the main energy distribution network. The inverter is able to supply electrical energy to.

Let's now focus on the particular architecture of the photovoltaic inverters. There are a lot of different design choices made by manufacturers.

The first important area to note on the inverter after the input side is the maximum PowerPoint tracking (MPPT) converter. MPPT.

Next, we find the "core" of the inverter which is the conversion bridge itself. There are many types of conversion bridges, so I won't cover different.

The most common method to achieve the MPPT algorithm's continuous hunting for the maximum PowerPoint is the "perturb and observe" method. Basically, with a predefined frequency, the algorithm perturbs the working.
