## Overview

---

Why do we need a smart grid and a microgrid?

The competitive landscape among energy providers and distributors has empowered consumers to not only save money on their energy bills but also incorporate sustainable energy sources into the grid. To efficiently manage electricity distribution, deregulated power systems must include a smart grid and microgrid (MG).

Are microgrids the future of power?

Many experts are turning to microgrids — small-scale, self-sustaining power networks unburdened by ties to a centralized power plant— as key agents of this transformation. Microgrids provide everything from greater reliability and resilience to cleaner power and economic development.

Are microgrids a good idea?

Below are a few of the difficulties: Although it has been stated that microgrids offer a superior solution to address small-scale issues and may even pave the way for a future "self-healing" smart grid, it is feasible that humanity may eventually adopt "smart super grid"-style grid architectural paradigms .

Are smart microgrids a threat to energy theft?

Energy theft, including smart microgrids, costs the global energy industry billions of dollars. The dispersed architecture and distributed energy supplies of smart microgrids make them more vulnerable to electricity theft than conventional power grids 5. Smart microgrids can analyze sensor and meter data to identify trends of energy theft.

What is microgrid architecture?

The microgrid architecture is categorized into three categories based on future smart grid vision, i.e., AC, DC, and hybrid microgrids. Elements that used in microgrid, control of generation, forecasting techniques, data

transmission and monitoring techniques are reviewed as smart grid functions.

Do MGs and smart grids contribute to long-term development?

MGs and smart grids have the potential to contribute to long-term development, but their implementation has economic and environmental implications. Practical advice is provided for integrating MGs or smart grids into deregulated energy systems to optimize electricity generation, distribution, and profitability for power-producing businesses.
