To find that point we employ a two-step strategy. First, find two adjacent points in slip for which the net shaft power (that is power minus friction and windage) are, respectively, negative and then positive. This means the actual operating point is somewhere between the two points.

Solved Problems

Use MATLAB to plot the high-side terminal voltage as a function of the power-factor angle as the load power factor varies from 0.6 leading through unity power factor to 0.6 pf lagging. Example 4: A single-phase load is supplied through a 35-kV feeder whose impedance is $95 + j 360 \text{ } \Omega$ and a 35-kV:2400-V transformer whose equivalent impedance is $(0.23 + j 1.27) \text{ } \Omega$ referred to its low ...
