

# Energy storage electric heating system in high temperature field

## Overview

What is high-temperature energy storage?

In high-temperature TES, energy is stored at temperatures ranging from 100°C to above 500°C. High-temperature technologies can be used for short- or long-term storage, similar to low-temperature technologies, and they can also be categorised as sensible, latent and thermochemical storage of heat and cooling (Table 6.4).

What are the benefits of a heat storage system?

Specific benefits compared with sensible and latent heat storage include a typically high energy density, long-term storage at room temperature with a simple start for heat generation, and the capability to operate in different heat pump modes.

What are the different types of thermal energy storage systems?

Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage. Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying.

What is high temperature thermal energy storage?

Of all components, thermal storage is a key component. However, it is also one of the less developed. Only a few plants in the world have tested high temperature thermal energy storage systems. In this context, high temperature is considered when storage is performed between 120 and 600 °C.

What is a sensitive heat storage system?

Sensible TES consists of a storage medium, a container (commonly tank) and inlet/outlet devices. Tanks must both retain the storage material and prevent

losses of thermal energy. The existence of a thermal gradient across storage is desirable. Sensible heat storage can be made by solid media or liquid media.

What is sensible heat storage (SHS)?

TES systems primarily store sensible and latent heat. Sensible heat storage (SHS) involves heating a solid or liquid to store thermal energy, considering specific heat and temperature variations during phase change processes.
