

Energy storage of ship s all- electric propulsion system

Overview

How does electric propulsion improve the efficiency of a ship?

The efficiency of the system is improved due to electric propulsion; the requirement for the mechanical power can be reduced by 14%, which reduces the overall fuel consumption compared with conventional power distribution systems. The ship reduced CO₂ emissions by over 40 per cent. NO_x emissions were reduced by over 80 per cent.

What are the three hybrid propulsion configurations?

The three hybrid propulsion configurations; serial, parallel, and serial parallel are explained in this section. Their advantages and disadvantages are revealed and compared. The next chapter will be about the energy management system and control strategies of hybrid ship propulsion systems.

5. Energy management systems.

How do all electric propulsion ships work?

The BESUs are connected to the bus through DC/DC converters in all electric propulsion ship, and each BESU has its corresponding controller. The controllers adopt a hierarchical control structure, which can provide enough accurate power for the all-electric propulsion ships and to ensure its safe operation.

Can electric propulsion ships be used in different capacities?

The experimental results of case B show that the proposed method can still be applied to BESUs of different capacities and has lower communication error, which provides more possibilities for the practical scheme of electric propulsion ships and increases the engineering feasibility.

Can a naval power system rely on a battery energy storage module?

This paper proposes a novel electric propulsion system for naval ships, which consists of Active Front End (AFE) converters directly connected to battery

Energy Storage Modules (ESMs). Employing the proposed AFE converters with ESMs in the power systems of naval ships can enhance the reliability and quality of the electric power.

Is electrification the future of ship propulsion?

Electrification of ship propulsion is increasingly recognised as a core part of the maritime industry's future, especially with the ongoing developments taking place in battery energy storage systems. From the perspective of recent developments, longer cycle life, higher energy density and decrease of manufacturing costs are expected.
