Overview

What is tank thermal energy storage?

Tank thermal energy storage is a well-established technology widely used in small- and large-scale building systems, including residential/commercial buildings as well as district levels .

What is a thermal energy storage system?

Many industries need to store thermal energy during the periods of excess production for use during periods of high thermal energy needs. A TES system equalizes the production and the consumption of thermal energy and shaves the energy demand peaks.

What are the different types of thermal energy storage technologies?

The STES technologies categorised in this paper are Tank Thermal Energy Storage (TTES), Pit Thermal Energy Storage (PTES), Borehole Thermal Energy Storage (BTES), and Aquifer Thermal Energy Storage (ATES). BTES and ATES are types of underground thermal energy storage (UTES).

Why should thermal energy storage systems be included in DHC systems?

Moreover, if the thermal production must follow the thermal load, inefficiencies easily increase. Thermal energy storage (TES) systems are included in DHC systems with the aim of intelligently manage the gap between demand and request.

Can thermal energy storage be used in district heating and cooling system?

This paper deeply reviews the use of thermal energy storage in district heating and cooling system. The following topics are investigated: Advantages and disadvantages of connecting TES to DHC, with a particular analysis of the various sources that can be used to feed DHC.

Which tank storage systems are connected to district heating networks?

The two largest seasonal tank storage connected to district heating networks are the Friedrichshafen storage and the Kungälv storage. These T-TEs are respectively 12.000 m³ and 10.000 m³. These are fed with a solar collector plant connected to DH system. DH utilizes both solar energy and boiler plants in order to cover the heat demand.
