## Overview

---

Goals that aim for zero emissions are more complex and expensive than net-zero goals that use negative emissions technologies to achieve a reduction of 100%. The pursuit of a zero, rather than a net-zero, goal for the electricity system could result in high costs.

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools.

Lithium-ion batteries are being widely deployed in vehicles, consumer electronics, and more recently, in electricity storage systems. These batteries have, and will likely continue to, be widely used.

The intermittency of wind and solar generation and the goal of decarbonizing other sectors through electrification increase the benefit of adopting pricing and load management options that reward all consumers for shifting electricity uses with some flexibility away.

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more efficient.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Are energy storage systems a good choice?

Thus to account for these intermittencies and to ensure a proper balance between energy generation and demand, energy storage systems (ESSs) are regarded as the most realistic and effective choice, which has great potential to optimise energy management and control energy spillage.

Who invented energy storage systems?

Table 1. Evolution of energy storage systems. In 1839, Sir William Robert Grove invented the first simple fuel cell. He mixed hydrogen and oxygen in the presence of an electrolyte and produced electricity and water. French physicist Gaston Planté invented the first practical version of a rechargeable

battery based on lead-acid chemistry.
