

# Eroei fotovoltaic

## Overview

---

- A recent paper by Ferroni and Hopkirk estimated an EROI=0.8 for PV in.

Net energy analysis, whose principal metric is the Energy Return on Energy Invested (ERoEI), hereinafter referred to by the alternative and more common acronym EROI, provides a.

Net energy analyses may be conducted using a variety of boundaries and assumptions, all of which, in principle at least, may be considered valid. In general terms, it is well e.

The paper by Ferroni and Hopkirk presents multiple data quality issues, which will be discussed in detail in this section. One fundamental point that is at the root of several of such is.

Ferroni and Hopkirk's calculation of the EROI<sub>ext</sub> of PV electricity in Switzerland is interspersed with a large number of digressions and unsupported claims, which we shall briefly a.

Can photovoltaic energy create a full EROEI?

Data are available from several years of photovoltaic energy experience in northern Europe. These are used to show the way to calculate a full, extended ERoEI. The viability and sustainability in these latitudes of photovoltaic energy is questioned. Use of photovoltaic technology is shown to result in creation of an energy sink.

What is energy invested for EROEI?

There are many definitions of the energy invested for the ERoEI. The article "Year in review-EROI or energy return on (energy) invested" ( Murphy and Hall, 2010) outlines some definitions for the EI such as: The energy required to collect, deliver, and use that energy.

What is energy return on Energy Invested (EROEI)?

In the present paper, the case of photovoltaic power sources in regions of moderate insolation is analysed critically by using the concept of Energy

Return on Energy Invested (ERoEI, also called EROI). But the methodology for calculating the ERoEI differs greatly from author-to-author.

What is EROI in physics?

EROI tells us about how much energy is obtained from a system of an energy source compared to how much of that energy is required to create and implement the system. Hence, EROI is a unitless ratio of the energy returned to the society to the energy required to make that energy (i.e. embedded energy).

Can the EROEI ext approach be applied to all energy sources?

We recommend that the ERoEI EXT approach be applied to all energy system sources, including nuclear energy. Therefore, the standards and protocols such as those recommended by the International Standards Organisation (ISO) and the International Energy Agency (IEA) can only be partially applied for the better calculation of the ERoEIEXT.

What does EROEI stand for?

The article “Year in review-EROI or energy return on (energy) invested” (Murphy and Hall, 2010) outlines some definitions for the EI such as: The energy required to collect, deliver, and use that energy. Most ERoEI analyses are not very clear in defining the system boundary for the energy invested.
