Overview

The Stored Energy at Sea (StEnSEA) project is a pump storage system designed to store significant quantities of electrical energy offshore. After research and development, it was tested on a model scale in November 2016. It is designed to link in well with offshore wind platforms and their issues caused by.

In 2011, the physics Prof. Dr Horst Schmidt-Böcking [] () and Dr. Gerhard Luther () had the idea of a pump storage system that would be placed on the sea bed.

The identification of potential installation sites was undertaken in three consecutive steps. At first, the designation of several arguments depicting the quality of a potential location were determined. Besides the installation depth, which is the main factor involved.

A video post on the public television station ZDF called the hollow concrete balls a “possible solution to store solar and wind energy”. The gained data helped to understand the project better. For further tests on a bigger scale Christian Dick, also a member of the.

The functionality of a seawater pressure storage power plant is based on usual . A hollow concrete sphere with an integrated will be installed on the bottom of the sea. Compared to well known pumped-hydro storage plants, the.

StEnSea is a modular high capacity energy storage technology. It's profitability depends on installed units (concrete hollows) per facility (causing), on the realized on the energy market and it depends on the operating hours per year. As well.

What is stored energy at Sea (StEnSEA)?

The Stored Energy at Sea (StEnSEA) project is a pump storage system designed to store significant quantities of electrical energy offshore. After research and development, it was tested on a model scale in November 2016. It is designed to link in well with offshore wind platforms and their issues caused by electrical production fluctuations.

What is pumped Energy at Sea (StEnSEA)?

“Storing Energy at Sea (StEnSea)” is a novel pumped storage concept for storing large amounts of electrical energy offshore. In contrast to well-known conventional pumped-hydro power plants, this concept greatly expands the siting possibilities, and allows for modular construction and ease of assembly.

How much does a buoyancy energy storage system cost?

The ocean has large depths where potential energy can be stored in gravitational based energy storage systems. The deeper the system, the greater the amount of stored energy. The cost of Buoyancy Energy Storage Technology (BEST) is estimated to vary from 50 to 100 USD/kWh of stored electric energy and 4,000 to 8,000 USD/kW of installed capacity.

Could a pump storage system be placed on the sea bed?

In 2011, the physics Prof. Dr Horst Schmidt-Böcking [de] (Goethe University Frankfurt) and Dr. Gerhard Luther (Saarland University) had the idea of a pump storage system that would be placed on the sea bed. This system would use the high water pressure at great water depths to store energy in hollow bodies.

Are deep ocean gravitational energy storage technologies useful?

The paper shows that deep ocean gravitational energy storage technologies are particularly interesting for storing energy for offshore wind power, on coasts and islands without mountains, and as an effective approach for compressing hydrogen.

How does a seawater pressure storage power plant work?

The functionality of a seawater pressure storage power plant is based on usual pumped-hydro storage plants. A hollow concrete sphere with an integrated pump-turbine will be installed on the bottom of the sea. Compared to well known pumped-hydro storage plants, the sea that surrounds the sphere represents the upper water basin.
