

# Future Solar Space Generator

## Overview

---

Can space-based solar power be used on Earth?

Space-based solar power, once a topic for science fiction, is gaining interest. The sun, photographed from the International Space Station about 260 miles above the Pacific Ocean. Wireless power transfer in space is opening the door to harnessing the power of the sun to provide usable power on Earth. NASA.

Can solar power be produced from space?

Solar power from space is also available continuously, whereas terrestrial renewables such as wind or solar power can't generate power when there is no wind or sun. These systems require storage to supply power in the down times, and extra capacity to replenish the storage and satisfy user demand when conditions allow.

Who is the 'godfather of space-based solar power'?

"All of the physics [of space-based solar power] have been demonstrated, tested, and verified," says John Mankins, a former Nasa physicist whose work on SBSP over more than 25 years has earned him the sobriquet "godfather of space solar power".

Could space-based solar power be a real thing?

Considered the realm of science fiction until recently, space-based solar power has been gaining more prominence lately with the world's leading space agencies launching development projects and feasibility studies that could lead to the first space-based energy harvesters flying in the next decade.

Could space-based solar power help a zero-carbon future?

Space-based solar power could also help wean the world off fossil fuels and contribute to a zero carbon future in line with calls of the international climate science community.

How does space-based solar power work?

Space-based solar power requires wirelessly transmitting electrical energy across space using microwave or laser power beaming. Unlike laser beams, microwaves can penetrate clouds and rainfall, making them the prime candidate for maximizing solar capacity.
