

# Generator air inlet and exhaust louver distance

## Overview

---

What is the intake/exhaust area of a generator?

Intake and exhaust areas are based on specified air velocities and a louver free area of 50% is used. Total required intake/exhaust areas are presented for the number of active generators and transformers. The documents contain calculations for sizing ventilation systems for generator rooms, transformer rooms and engine rooms.

How should a generator be ventilated?

Preferably, the source of ventilation air should be as low as possible and the air should flow over the entire generator set, thereby cooling the alternator, engine block, and radiator (for sets with unit-mounted radiators) to remove the after-cooler and jacket-water heat.

Where should a generator be located?

Due to site constraints, the generator sets had to be housed within the building near grade level. A simple solution was to locate ventilation air louvers, radiator-discharge louvers, and flue exhaust on the same side of the building.

Where should exhaust air be sourced for a generator?

For generators with remote radiators, it is recommended that the exhaust air should be sourced as high as possible and directly above the generator sets. Significant bypass of ventilation airflow directly into the discharge airflow will lead to reduction in cooling effectiveness and elevated temperatures within the room.

Why do genset rooms have louver fins?

The louver fins should have openings of sufficient dimensions to make sure that air circulation is not being blocked. Otherwise, the occurring backpressure might cause the genset to overheat. The biggest mistake made in this regard

in genset rooms is the use of louver fin structures designed for transformer rooms rather than genset rooms.

What should a genset room look like?

The genset room floor should be liquid-tight to prevent leakage of oil, fuel, or cooling liquid into nearby soil. The generator room design must also comply with fire protection regulations. The generator room should be clean, dry, well-lit, well-ventilated.

## Generator air inlet and exhaust louver distance

### [Generator Room Ventilation Requirements](#)

Exhaust fans must be placed at heights and vertically above the generator for heat extraction and undesirable emissions. To Conclude Understanding the generator room ventilation intricacies and requirements is a ...

### **Info-606: Placement of Intake and Exhaust Vents**

Placement of Intake and Exhaust Vent Detail Photograph 1 Outdoor Air Intake Grille Location. Intake located 2 feet above grade. Area around intake location is free of ...
