

# **Generator inlet and outlet air temperature requirements**

## Overview

---

What if the engine room temperature exceeds 40°C?

If the engine room temperature exceeds 40°C (104°F), the generator must be derated per the generator derate schedule and cool outside air must be ducted directly to the generator air intake. Alternatively, custom generators can be sized to handle specific ambient conditions.

Does a generator need ventilation?

Large generators, configured with an air inlet positioned high on the generator, will require an additional source of ventilation air. If Ventilation Type 1 or Type 2 is not feasible, an alternative is Type 3; however, this routing configuration will require approximately 50% more airflow than Type 1.

What temperature should an engine room/enclosure be?

In all cases, engine room/enclosure design must ensure that air temperature around the engine will not exceed 50°C (122°F). Critical locations include the engine torsional damper and generator coupling. Air temperature reading should be taken no more than 6 inches away from these components.

Does a generator intake need cool air?

It is important to note that cooling air is needed for more than just the engine; the generator intake also requires cool clean air. The most effective way to do this is to provide a ventilation air source low to the ground at the rear of the package.

What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

How is maintenance performed on a diesel generator?

Maintenance is executed in accordance with the supplier requirements. The EDG control system monitors the diesel generator support system. Alarms essential for the availability of the system are transmitted to the MCR. The air filters are monitored for differential pressure and the temperature of the exhaust gas is monitored.
