

Generator room exhaust control circuit diagram

Overview

Which parts of a generator need isolation?

Components that require isolation include the engine exhaust system, fuel lines, AC power supply wiring, load wiring, control wiring (which should be stranded, rather than solid core), the generator set (from the mounting pad), and ventilation air ducts (for generator sets with skid-mounted radiators) (See Figure 6-1).

Can a generator be connected to an exhaust system?

Horizontal exhaust outlets may be cut off at an angle and protected with birdscreen. Rain caps can freeze closed in cold environments, disabling the engine, so other protective devices may be best for those situations. A generator set should not be connected to an exhaust system serving other equipment, including other generator sets.

What are the maintenance procedures for a generator set?

Maintenance procedures for the generator set should include regular draining of condensate from the exhaust system. Provisions to prevent rain from entering the exhaust system of an engine that is not operating should be provided. This might include rain cap or exhaust trap (Figure 6-9 and 6-10) on vertical exhaust outlets.

How do I design a generator room?

Space and room requirements for EPSs shall be determined and accounted for during the Schematic Design Phase. Locating the room above the lowest level of the building is preferred. Separate the generator room from occupied areas or provide sound-proofing and vibration isolation so the EPS will have minimal impact on surrounding areas.

What is engine room ventilation?

This guide addresses engine room ventilation considerations that apply to the

successful installation, operation and maintenance of Cat engines, generator sets, compressor units, and other packaged units. The primary aspects of a properly designed engine room ventilation system are cooling air and combustion air.

Where should a generator room be located?

Locating the room above the lowest level of the building is preferred. Separate the generator room from occupied areas or provide sound-proofing and vibration isolation so the EPS will have minimal impact on surrounding areas. Generator room designs should maintain the sound criteria of the surrounding areas.
