## Overview

---

Space heating means heating the space inside a building. Today, many homes use solar energy.

The heat from a solar collector can also be used to cool a building by using solar absorption coolers. Solar heat is an energy source. Home air conditioner uses an energy source, el.

Solar thermal power plants use the sun's rays to heat a fluid to very high temperatures. The fluid is then circulated through pipes so it can transfer its heat to water to produce.

The most common use for solar thermal technology is for domestic water heating. Hundreds of thousand of domestic hot water systems are in use throughout the world. A solar water heater works a lot like solar space heating. In north hemisphere, a solar collector is mounted on the south side of a roof where it can capture.

Space heating means heating the space inside a building. Today, many homes use solar energy for space heating. Solar space heating systems can be classified as passive or active. A.
