

Heating system energy storage

**FLEXIBLE SETTING OF
MULTIPLE WORKING MODES**

Overview

What are the different types of thermal energy storage systems?

Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage. Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying.

What is thermal energy storage?

Thermal energy storage or thermal stores are vessels used to store excess heat generated from a domestic renewable heating system. A thermal store is a way of storing and managing renewable heat until it is needed. Heated water is usually stored in a large, well-insulated cylinder often called a buffer or accumulator tank.

What are the different types of heat storage systems?

Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying. Thermochemical heat storage systems store heat by breaking or forming chemical bonds.

How do you store energy?

You can store electricity in electrical batteries, or convert it into heat and stored in a heat battery. You can also store heat in thermal storage, such as a hot water cylinder. Energy storage can be useful if you already generate your own renewable energy, as it lets you use more of your low carbon energy.

Can thermal energy be stored in a heat storage media?

Thermal energy (i.e. heat and cold) can be stored as sensible heat in heat storage media, as latent heat associated with phase change materials (PCMs) or as thermo-chemical energy associated with chemical reactions (i.e. thermo-

chemical storage) at operation temperatures ranging from -40°C to above 400°C .

What is a storage heater?

Storage heaters mean you can take advantage of lower off-peak electricity rates to heat your home. They are part of an electric heating system and you'll need a time-of-use tariff (such as Economy 7 or Economy 10) to access cheaper electricity prices.
