## Overview

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ( $<10 \text{ W/ (m} \cdot \text{K)}$ ) limits the power density and overall storage efficiency.

What is a phase change material?

**Phase Change Material** A material that stores heat in the form of latent heat of fusion. Paraffin A white, odorless, tasteless, waxy solid to store heat with a specific heat capacity of  $2.14\text{--}2.9 \text{ J g}^{-1} \text{ K}^{-1}$  and a heat of fusion of  $200\text{--}300 \text{ J g}^{-1}$ . **Sensible Heat** The heat energy stored in a substance as a result of an increase in its temperature.

How does a phase change work?

They operate by storing energy at a constant temperature while phase change occurs, for example from solid to a liquid, as illustrated in the center of Figure 8.6.1. As heat is added to the material, the temperature does not rise; instead heat drives the change to a higher energy phase.

Are phase change materials suitable for heating & cooling applications?

The research, design, and development (RD&D) for phase change materials have attracted great interest for both heating and cooling applications due to their considerable environmental-friendly nature and capability of storing a large amount of thermal energy in small volumes as widely studied through experiments [7, 8].

How do phase change materials (PCMs) work?

**How Phase Change Materials (PCMs) work** Traditionally heat is stored in water by gradually adding energy until it achieves a safe maximum temperature (usually  $75^\circ\text{C}$  if a blending valve can be used). At this point it is no longer

possible to store any more energy.

How can a phase change material be used in a solar system?

The solution is to install a quantity of phase change material with a very high latent heat capacity storing a relatively large quantity of heat during the solar rich months so this heat can be given off when required.
