

How long is the life of a wind turbine generator set

Overview

There is very little data on modern turbines reaching their life expectancy so it is largely unknown how long they will be operable. Modern wind turbines have over 8,000 parts (broken down into three major components) and blades as long as 262 feet, the same length as the wingspan of an Airbus . With higher.

Modern wind turbines are designed to last 20 years and with proper monitoring and preventative maintenance two to three times per year (increasing with frequency as the turbine ages) their lifetime can be extended to 25 years .

Why do most wind turbines fail?

Externally, the reasons may be birds, lightning, rainfall, blade detachment, delamination, blade cracks . Internally, electrical and mechanical.

About 85% of all turbine components can be recycled, such as steel, copper wiring, electronics and gearing . The blades, however, are made from fiberglass and more difficult to recycle.

By repowering projects, output can be increased by 10% or more allowing for additional electricity generation without applying for new permits or interconnection fees . In.
