

How to check if the generator wind temperature is high

Overview

How do I know if my generator is overheating?

If the windings themselves are overheating, this could be a sign that the resistance of the copper used to wind the stator on this generator is higher than the others on the wind farm. Check this by examining the generator factory acceptance test certificate.

What is a wind turbine generator failure analysis & fault diagnosis?

In this article, a comprehensive and up-to-date review of wind turbine generators failure analysis and fault diagnosis are presented. First, the electrical and mechanical failures of various WTG components, including stator, rotor, air gap, and bearings, are analyzed. Then, the fault characteristics and root causes of WTG are studied.

Which approach is best for wind turbine generator fault diagnosis?

Finally, the application of four categories of model-based, signal-based, knowledge-based and hybrid approaches to wind turbine generator fault diagnosis is summarized. The comprehensive review shows that the hybrid approach is now the leading and most accurate tool for real-time fault diagnosis for wind turbine generators.

What are the common faults of a wind turbine generator?

Common faults of wind turbine generator. Generator electrical faults are mainly stator eccentricity, rotor eccentricity, broken rotor bars, and looseness. The main manifestations of generator stator faults are overheating of stator windings, insulation damage, and grounding.

Where do wind turbine sensors record temperature?

Usually sensors record the temperature of at least three locations in the gearbox. Sensor locations include driven-end (DE) bearing, Non-driven-end (NDE) bearing and oil sump temperature. Generator – generator bearings can

also constrain wind turbine output.

Why do wind turbines have a low cooling capacity?

Development of recent high-efficiency generators and motors leading their designs with less cooling capacity. Bearings are one of the most stressed components in the generator. Recent studies have indicated that bearing failure is the prime cause of generator failure, in wind turbine application.
