

How to find planets in the sky

Lithium Solar Generator: \$150

Overview

How do you find a planet in the night sky?

Look in the right part of the sky. The planets are rarely near one another in the night sky. Knowing where to see them is very important. A great way to find them is to locate them when they appear as part of a constellation.

Mercury: Mercury will be visible near the Sun.

Can you see planets in the night sky?

Know what time to look. Most of the planets are most visible as the sky gets dark (dusk) or as the sky begins to brighten again (dawn). However, looking for them in the night sky is also possible. You have to look very late at night, when it is incredibly dark out.

How do you find a planet using a telescope?

Find the planet using the naked eye, then point your telescope at it. If you have a telescope with setting circles or a guidance program, then you can look online for the co-ordinates of the planet and then point your telescope at the correct co-ordinates.

Where can I find a detailed view of a planet?

See the indispensable Observer's Handbook, from the Royal Astronomical Society of Canada. Visit Stellarium-Web.org for precise views from your location. Almanac: Bright visible planets (rise and set times for your location). Visit TheSkyLive for precise views from your location.

How do you know if a planet is visible?

Find your planet's apparition period. The apparition period is the time that your planet is visible. It can last anywhere from a few weeks to almost two years. You can look these up in most astronomy catalogues to figure out when your planets are visible.

What can you see on a night sky map?

The map includes the Moon, stars brighter than magnitude 5, the five bright planets (Mercury, Venus, Mars, Jupiter, and Saturn), and deep-sky objects that can be seen without the use of optical aid. [How Do I Use the Interactive Sky Chart to Explore the Night Sky?](#)
