

How to realize photovoltaic panels turning towards the sun

Overview

To make sure the solar panels are pointing towards the sun for the majority of the day, UK solar panel owners should have their panels facing southwards. Why does solar panel orientation and angle matter in a solar power system?

Prior to understanding why solar panel orientation and angle matter in a solar power system, we need to know how a solar panel collects energy from the sun. Solar panel cells only collect a specific wavelength during absorbing radiant energy from the sun.

How do I choose a solar panel?

Reading the Map: Key elements include azimuth angle (compass direction) and elevation angle (Sun's height). These help determine the best placement and tilt for solar panels. Seasonal Variations: Sun paths vary seasonally; understanding these changes helps adjust solar panel angles throughout the year to maximize energy capture.

Why do solar panels need a direction map?

Sun direction maps are essential for optimal solar panel placement. Understanding the sun's path helps you find the best angles and orientations for your panels, maximizing energy production. Optimal Angle and Azimuth: Solar panels should be tilted at an angle equal to the latitude of the location.

Which direction should solar panels go?

Rather sticking to the rule of thumb is advisable. For example, Hawaii is in the northern hemisphere, so the optimal direction is south. Also, the impact of the azimuth angle of solar panels on power production decreases as we move toward the equator. It is because the tilt angle of panels becomes very small near the equator.

How do solar panels work?

Solar panels absorb the falling sunlight and convert it into electricity. To have maximum solar power, you must face your solar panels right in front of the sun. It is practically impossible to always have solar panels facing the sun. That is because the position of the sun in the sky changes every hour.

Can solar panels always face the Sun?

It is practically impossible to always have solar panels facing the sun. That is because the position of the sun in the sky changes every hour. And with that, the solar azimuth also changes continuously. Solar trackers could solve this problem since they monitor the position of the sun in the sky and direct solar panels accordingly.
