

# **How to shut down the Fengchao generator**

## Overview

---

As a portable generator owner, it's important to know how to properly shut down your generator to ensure it runs safely and efficiently for years to come. The improper shutdown.

How do you turn a generator off?

Simply switch the button or knob on your generator to the OFF position. Alternate ways to shut off a whole house generator include switching the breaker, turning off the gas valve, or pulling the electrical disconnect. In this article, we're going to take a look at the best ways to turn a generator off and when a good time is to shut it down.

How to shut down a generator?

It is very important to remove the load (devices and equipment pulling power from the generator) prior to shutting it down. 1. Set the main utility disconnect to OFF (OPEN). 2. Set the generator MLCB (generator disconnect) to OFF (OPEN). 3. Allow the generator to run without load for a minimum of 5 minutes. 4.

When should you turn off a generator?

You can and should turn your generator off occasionally. However, if you have vital electrical appliances, ensure that you can do without power before shutting off your generator. Here are a few instances when you should always turn off your generator.

What happens if a generator is turned off?

Switched to off, hours of protection or system will be flashing. During utility outages, follow the specified steps to turn the automatic backup generator OFF and ON while avoiding equipment damage.

Can a whole house generator be turned off?

Whole house generators are commodities designed to provide power to your house or workshop in case of power outages. If you're afraid of the dark or

have essential appliances that can never be without power, a whole house generator is a saving grace. Turning off a whole house generator is pretty straightforward on most units.

How do you shutdown a standby generator?

Follow the manufacturer's recommended shutdown sequence for your standby generator. This typically involves activating the control panel and initiating the shutdown process. After the load is fully reduced, allow the generator to run at a no-load condition for a few minutes. This helps in cooling down components before the final shutdown.
